| Lesson: Scientific Notation | Name: | | | |
|--|---|--|--|--|
| Teacher: | Date: | | | |
| Space Distance Model Project Plan/Blueprint – Research & Design Sheet | | | | |
| Benchmark: MA.8.NSO.1.4 – Express numbers i in real-world problems. | in scientific notation and use them to represent quantities | | | |
| Step 1 – Choose Your Celestial Pair | | | | |
| Circle your chosen pair of celestial bodies: $\square \ \text{Earth} \to \text{Moon} \square \ \text{Earth} \to \text{Sun} \square \ \text{Venus} \to \text{Earth} \square \ \text{Earth} \to \text{Mars} \square \ \text{Sun} \to \text{Mercury}$ | | | | |
| Why did your group choose this pair? | | | | |
| | | | | |
| Step 2 – Research & Write (Science Conne | ection) | | | |
| Use reliable sources (NASA, space facts, etc.) to Write a short paragraph for each celestial body | ž | | | |
| Celestial Body 1: | | | | |
| (Write a short research paragraph — include size, c | composition, orbit, and unique facts.) | | | |
| | | | | |
| | | | | |

| Celestial Body 2: |
|--|
| (Write a short research paragraph — include size, composition, orbit, and unique facts.) |
| |
| |
| |
| Step 3 – Research Data Table |
| Celestial Body Diameter (km) Distance from Earth or Sun (km) 3–5 Fun Facts |
| Body 1: |
| Body 2: |
| Sources Used: |
| |
| |

Step 4 – Convert to Scientific Notation (Math Connection)

Now, take the large numbers you found and convert them into scientific notation.

| Quantity | Standard Form | Scientific Notation |
|-----------------|---------------|---------------------|
| Distance | km | |
| between the two | | |
| bodies | | |
| Diameter of | km | |
| Body 1 | | |
| Diameter of | km | |
| Body 2 | | |

✓ Helpful Reminder:

• Move the decimal until there is 1 whole number before it.

- Left = positive exponent, Right = negative exponent.
- Example: $149,600,000 \rightarrow 1.496 \times 10^8$

Step 5 – Model Design Sketch (Engineering Connection)

Use the blank space below to sketch your model layout. Label each celestial body, show the connecting string (distance), and where your index cards with scientific notation and facts will go.

■ Sketch your model here

Step 6 – Summary of Display Facts (Communication Connection)

Write a short paragraph summarizing what information your group will include on the actual project display (the facts and features that viewers will see at first glance).

Example: "Our project shows the distance between Earth and the Moon. We included their diameters, surface descriptions, and the scientific notation of their distance."

| Summary: | | |
|----------|--|--|
| | | |
| | | |
| | | |
| | | |
| | | |
| | | |

Step 7 – Group Roles

| Role | Name | Responsibility |
|-------------------|------|---------------------|
| Designer/Engineer | | Builds and |
| | | assembles the |
| | | model |
| Researcher | | Gathers accurate |
| | | facts and data |
| Recorder | | Converts data into |
| | | scientific notation |
| | | and labels model |
| Presenter | | Leads oral |
| | | presentation and |
| | | explanation |

Step 8 – Reflection

| 1. | What is the most interesting thing you discovered about your celestial bodies? | |
|----|--|--|
| | | |
| 2. | How does scientific notation help you understand these large distances better? | |
